STRATEGIES MIGRATION SERVICES
Strategic Migration Partner

INSY7315 · WORK INTEGRATED LEARNING · TASK 2

Implementation Access and Links

Strategies Migration Platform · built by Nexus Solutions for Strategies Migration Services · INSY7315 Information Systems 3E

Where the system runs, where the code lives, and a demo account for each role.

1. Team: Nexus Solutions

Name and surname	Student number	Main area
Marco Alexandre George Hart	ST10462493	Team lead · API and AI triage
Kaan Dogan	ST10442156	Authentication and security
Lekabe Herman Mabalane	ST10278399	Database (PostgreSQL on Supabase)
Kundai Makuzha	ST10251297	Android mobile app
Mbulungeni Kenneth Muthambi	ST10447819	GitHub, CI/CD and hosting
Riaad Hercules	ST10258492	React web portal, integration testing and docs

3. Test accounts

These come from our demo seed data. They exist only for marking and demonstration and hold no real client information.

Role	Email	Password
Administrator	`admin@nexus.com`	`AdminPassword123!`
Consultant	`consultant@nexus.com`	`ConsultantPassword123!`
Client	`client@nexus.com`	`ClientPassword123!`

The Android app is for clients only, so use the client account there. Staff accounts are turned away by design and pointed to the web portal.

4. A five-minute tour

Sign in as	What to look at
Administrator	**Overview** for live numbers and consultant workload · **Users** to search, suspend, reinstate and deactivate accounts · **Leads** for every enquiry and the AI's verdict · **Cases** to assign a consultant and use **Export CSV** · **Audit log** for who changed what, and when.
Consultant	**Lead triage**: open a lead, read the agent's reason, then confirm or change the verdict · **My cases**: open a case, move it to the next stage, and approve or reject a document (a rejection needs a note for the client).
Client	**My case** shows the 5-stage journey and what to do next · **Documents** shows what was approved or rejected, and lets the client upload a new copy of a rejected document.
No account	The public enquiry form at `/#/enquire` on the live web portal. Every enquiry is triaged by the server before a consultant sees it.

5. Where things are in the repository

`README.md`	What the system is, architecture diagram, quick start for all three parts, screenshots
`Strategies.Api/`	ASP.NET Core API (.NET 10), EF Core migrations, services and controllers
`Strategies.Api.Tests/`	API unit tests (xUnit)
`strategies-web/`	React web portal and its tests (Vitest)
`strategies-mobile/`	Android app (Kotlin, Jetpack Compose) with build steps in its README
`database/seed/`	Demo data scripts and the seed accounts above
`.github/workflows/ci.yml`	The CI pipeline: .NET build and test, React lint, test and build
`docs/`	`TESTING.md` (test plan and results), `ISSUES.md` (issue log), `USER_GUIDE.md` (user guide)

6. Good to know while marking

- **Sign-in is rate limited** to 5 attempts a minute from one address. After a few wrong passwords, wait a minute before trying again.
- **AI triage has a fallback.** If the AI service is unavailable, a new enquiry is saved as *Needs review* for a consultant instead of being lost.
- **Known gaps are written down** in `docs/ISSUES.md`, each with an owner and a suggested fix.
